An insight into the **Rainbow approach**

Dr. Ramesh Kancharla

Pediatric Healthcare Visionary

Chairman & Managing Director

Dr. Ramesh comes from an agricultural background from a village in Andhra Pradesh, India where the accessibility to healthcare was very poor. This motivated Dr. Ramesh to pursue medical education

Garnered rich experience in pediatric gastroenterology and liver disease at best pediatric hospitals in the United Kingdom and got exposed to the nuances of pediatric healthcare model at these hospitals

Lack of quality pediatric healthcare in the country and his resolve that no child should suffer due to lack of dedicated medical facilities led to the foundation of Rainbow Children's Hospitals in 1999

Rainbow is currently the country's largest pediatric hospital chain with 26 hospitals spread across 11 cities

Bestowed with Healthcare leader of year award by the Financial Express, Healthcare award, 2024

A novel approach to healthcare delivery

RAINBOW'S UNIQUE OPERATING MODEL

Comprehensive Pediatric multispecialty and maternal care

From conception to adolescence – under one roof

- Widest suite of Pediatric and perinatal services, from routine to quaternary care
- Child-centric hospitals designed around children and families
- Seamless continuum across obstetrics, foetal medicine, NICU and Pediatrics

Multidisciplinary approach

Complex care with outcomes to match

- Level-4 NICU and ~1/3 of beds dedicated to critical care
- Quaternary capabilities – transplants, ECMO, foetal medicine, neonatal surgery
- 3 JCI- and 14 NABH-accredited hospitals

Outstanding clinical model

Full-time, consultant-led care, 24/7

- 1,100+ full-time doctors working in multidisciplinary teams
- Country's largest private Pediatric DNB and DrNB training programme
- Institution-first culture driving retention and consistent quality of care

Hub-and-spoke network for care at scale

Optimising patient care delivery across cities and regions

- Super-speciality hubs for quaternary and complex care, with emergency and OP services across the network
- Regional spokes deliver tertiary care in tier-II cities
- One integrated clinical network extends hub expertise to every spoke

PERFORMANCE THROUGH DESIGN

High governance standards

High-quality clinical outcomes

Prudent, capital-efficient expansion

Serving India's large mother & child healthcare market

Comprehensive care through a multidisciplinary approach

One family, one care team: Integrated care where obstetric and Pediatric teams work together, before and after birth

From everyday care to the most complex

Rising complexity →

¹ National Board of Examinations – training in Pediatrics, Neonatology, Pediatric Intensive Care, Pediatric sub-specialties, Obstetrics & Gynaecology

Hub and Spoke approach to optimise delivery of patient care services at scale

City level: hub-and-spoke model

Regional level: 'South Connect' model

Regional spokes

- 200-250 km from city hubs, in tier-II cities
- Act as a bridge to address a large market

Care closer to home

- High-quality Pediatric, obstetric & gynaecology care
- Emergency services for mothers and children

Connected to the hub

- Robust transport network to save sick newborns & children from districts
- Pediatric sub-specialty outreach clinics in districts

Board of Directors

Dr. Ramesh Kancharla

Chairman & Managing Director
MD (Pediatrics) & MBBS (UK)

- Specialist in Pediatric Gastroenterology, Hepatology and Nutrition
- Worked in prestigious hospitals such as King's College Hospital, London, Great Ormond Street Children's Hospital – London and is a member of the Royal Colleges of Physicians of the United Kingdom
- Bestowed with 'healthcare leader of year' award at the Financial Express, Healthcare award, 2024

"It takes a lot to treat the little"

South India's youngest baby successfully receives liver transplant

- A six-week-old baby weighing just 2.9 kg developed jaundice in the first week of life, progressing rapidly to severe liver failure by the third week. Investigations revealed a rare condition called Gestational Alloimmune Liver Disease (GALD), and initial treatments with intravenous immunoglobulin and two exchange transfusions failed to halt the deterioration.
- With the baby's life at risk, Rainbow Children's Hospital, Banjara Hills, performed a complex living-donor liver transplant using a 62-gram graft from the mother. The procedure was particularly challenging due to the baby's tiny blood vessels and limited abdominal space, requiring exceptional surgical precision to connect the blood vessels and position the graft safely.
- The post-operative journey was quite stormy with pulmonary complication, and the child required an additional intestinal surgery for obstruction. The baby was managed on parenteral nutrition during the ICU stay of 3 weeks and discharged after another week of stay with a well functioning liver.
- **This landmark surgery demonstrates Rainbow's ability to perform highly complex neonatal transplants, combining advanced surgical expertise, specialised intensive care and multidisciplinary teamwork to save even the smallest and most critically ill patients.**

METRO INDIA

2.9-kg baby gets liver transplant

METRO INDIA NEWS | HYDERABAD

A six-week-old baby weighing just 2.9 kg has successfully undergone a living-donor liver transplant at Rainbow Children's Hospital, Banjara Hills, in what the hospital described as South India's smallest paediatric liver transplant.

The baby developed jaundice in the first week of life and progressed to severe liver failure by three weeks. Doctors suspected Gestational Alloimmune Liver Disease (GALD), a rare condition, after ruling out infections, metabolic disorders and genetic causes.

Treatment with intravenous immunoglobulin and two exchange transfusions failed, prompting doctors to proceed with a transplant. The baby received a 62-gram liver graft donated by his mother.

The procedure was challenging because of the infant's tiny blood vessels and limited abdominal space. Surgeons reduced the graft to fit the baby and carefully connected the

vessels.

Recovery was also complicated by severe lung problems requiring high-frequency ventilation, inhaled nitric oxide and bronchoscopy. The baby later developed serious infections involving antibiotic-resistant bacteria.

A leak near an intestinal surgical join required a second operation and temporary stomas. Prolonged intravenous nutrition was provided before oral feeds were gradually restarted.

Dr Prashant Bachina said early diagnosis and timely transplantation can be crucial in rapidly progressive liver failure. Dr Mettu Srinivas Reddy said the procedure required meticulous planning, surgical precision and close teamwork. The transplant involved specialists in hepatology, transplant surgery, anaesthesia, neonatal and intensive care, paediatric surgery, radiology, nutrition, physiotherapy, infection control and transplant nursing.

**INDIAN
CHRONICLE**

epaper.indianchronicledaily.com
09 Oct 2026 - Page 2

Rainbow Children's Hospital Performs Liver Transplant on 2.9-kg Baby

"Hyderabad Correspondent, October 8 (Indian Chronicle): A six-week-old baby weighing just 2.9 kg has successfully undergone a living-donor liver transplant at Rainbow Children's Hospital, Banjara Hills, after developing rapidly progressive liver failure caused by the rare Gestational Alloimmune Liver Disease (GALD). The hospital described the case as a landmark procedure involving what it termed South India's smallest baby to undergo a liver transplant. The infant received a 62-gram liver graft donated by the mother, which was carefully reduced to match the baby's size. The surgery was particularly challenging because of the newborn's extremely small blood vessels and limited abdominal space. Surgeons had to precisely connect the tiny blood vessels and position the graft safely, the hospital said. The baby developed jaundice during the first week of life, progressing to severe liver failure by the third week. After infections, metabolic disorders and genetic causes were excluded, doctors suspected GALD. Intravenous immunoglobulin and two exchange transfusions failed to stop the deterioration, leading to the decision to proceed with transplantation. Post-operative recovery was complicated by severe lung problems requiring advanced respiratory support, including high-frequency oscillatory ventilation and inhaled nitric oxide. The baby also developed resistant bacterial infections and an intestinal leak that required a second surgery and temporary stoma. Following prolonged nutritional support and multidisciplinary care, oral feeds were gradually resumed. The baby was eventually discharged breathing without oxygen and taking full feeds by mouth. Dr Prashant Bachina, paediatric gastroenterologist and hepatologist, stressed the importance of early diagnosis and timely transplantation. Dr Srinivas Reddy Mettu, paediatric liver transplant surgeon, said the procedure required meticulous planning, precision and close teamwork. The hospital said its paediatric liver transplant programme across Hyderabad, Chennai and Bengaluru has completed 107 transplants, with an overall survival rate of 95%.

- A previously healthy 2.5-year-old child presented with widespread body swelling and significant protein loss through the urine, indicating a serious kidney disorder. Despite six weeks of standard steroid treatment for nephrotic syndrome, the condition did not improve, raising concerns about steroid-resistant nephrotic syndrome.
- The kidney biopsy revealed an extremely rare condition called lipoprotein glomerulopathy, in which abnormal fat deposits accumulate within the tiny blood vessels of the kidneys. Genetic testing confirmed an associated variation in the APOE gene, helping establish the diagnosis. **This was reported as the third and youngest Pediatric case of its kind in India.**
- Following the diagnosis, steroids were gradually withdrawn and lipid-lowering treatment with atorvastatin was initiated. Within just three weeks, urinary protein loss reduced significantly, while the child's lipid profile and blood albumin levels improved.
- **This case highlights the need of Pediatric nephrology services with advanced genetic testing in identifying and treating rare kidney diseases, enabling targeted treatment and potentially improving long-term outcomes.**

Born with an Extra Limb: A Remarkable Surgical Journey

- A full-term newborn, born to a mother with gestational diabetes, was noted at birth to have a rare and striking abnormality—an extra limb-like structure arising from the perineal region, a condition known as polymelia (pyromelia).
- Despite this, the baby cried at birth and was initially stable.
- As such malformation can be associated with serious internal defects, a detailed evaluation was urgently undertaken. Brain and abdominal ultrasounds were normal. Imaging of the spine showed a low-lying spinal cord with an associated fatty mass, suggesting a condition called lipomyelocoele, a form of closed spinal dysraphism.
- Advanced scans also confirmed that the extra limb was not connected to the spinal cord, consistent with a rare condition called polymelia (extra limb formation).
- **A multidisciplinary team involving neonatology, pediatric surgery, radiology, anesthesia, and neurosurgery performed the complex surgery.**
- The baby underwent successful surgical excision of the perineal limb appendage. The operation was delicate due to the proximity to the spine, pelvis, and rectum, but the abnormal structures were completely removed without neurological injury.
- The parents were counselled for follow up for the associated spinal dysraphism.
- **This rare case highlights how a life born with an extraordinary anatomical anomaly can be safely guided toward a normal future through precise imaging, multidisciplinary care, and timely surgery.**

Rainbow Children's Medicare Limited operates a network of 26 hospitals, 6 clinics and 2 dedicated fertility clinics across 11 cities, with a total bed capacity of 2,685¹ beds. Its pediatric services, operating under the brand "Rainbow Children's Hospital", include newborn and pediatric intensive care, pediatric multi-specialty services and pediatric quaternary care, including organ transplantation. Its women's healthcare services, under "BirthRight by Rainbow", encompass normal and complex obstetric care, multidisciplinary fetal care, perinatal genetic and fertility care, and gynaecology services.

Rainbow Children's Hospital built on strong fundamentals of multidisciplinary approach with a full-time consultant led clinical service along with 24/7 commitment in a child centric environment. The company follows a hub-and-spoke operating model where the hub hospital provides comprehensive outpatient, inpatient care, with a focus on tertiary and quaternary services, while the spokes provide emergency care in pediatrics and obstetrics, large outpatient services and comprehensive obstetrics, pediatric and level 3 NICU services. This model is successfully operational at Hyderabad and is gaining traction in Bengaluru. The endeavor is to replicate this approach in Chennai and across the National Capital Region. Subsequently Rainbow intends to expand into tier-2 cities of Southern India.

Rainbow embraces a unique doctor engagement model, where doctors work exclusively on a full-time, retainer basis. The doctors work in teams and have 24/7 commitment, which is particularly important for children's emergency, neonatal, pediatric intensive care services and to support pediatric retrieval services. The Company also operates the country's largest pediatric DNB training programme in private healthcare, offering post graduate residential DNB and fellowship programme.
